

What Are You Proving?

Nayab Khalid · nayab.khalid13@gmail.com · nayab-khalid.github.io

Proof statement

I build machine learning products end to end. SkinSpectrum is the proof: I wanted an app that could tell me about my own skin, so I built the whole thing myself — trained an 8-condition classifier and a melanoma model on ISIC and HAM10000, wrapped them in a React Native app on a MongoDB backend, then tested that melanoma model across skin tones and published the finding that it becomes less reliable as skin darkens, on exactly the Pakistani users it was built for. The person I want reading this is the founder or ML lead of an early-stage applied-AI company hiring a remote graduate engineer — small enough to hire across borders, and who needs one person who can take an idea all the way to something that works. I want them to email me about the part they found interesting.

Why this needs to exist

My CV can say I researched skin-tone bias; it cannot show the six re-toned photos, the four flipped verdicts, or the fact that I chose to publish my own model failing — and that evidence is the only thing that makes the claim believable.

Checked against the brief

- **One primary claim** — Building machine learning products end to end — named, singular.
- **One person** — The founder or ML lead of an early-stage applied-AI company hiring a remote graduate engineer.
- **One action** — Email me about the part they found interesting.
- **Only my proof** — SkinSpectrum, the ISIC/HAM10000 melanoma model and the skin-tone finding are specific to my work.
